MODULE 14 · DOMAIN 4 - WORKFLOW INTEGRATION AND SOLUTION DESIGN

Use Cases and Requirements with Claude

Where Claude adds the most leverage, where it adds the least, and how to turn interviews and documents into requirements you can trace.

DOMAIN 4 of 7 EXAM WEIGHT 16% MODULE 14 of 33

admin@sthithapragna.com

Claude drafts and synthesises. People decide.

admin@sthithapragna.com

Where Claude adds the most leverage, and the least

MOST LEVERAGE	LEAST LEVERAGE
Drafting first versions for a person to review	Final decisions with real consequences
Synthesising across many long sources	Facts it cannot see, such as live system data
Extracting and structuring from documents	Exact sums done in its head, without code
Comparing options against criteria	Judgement that needs accountability or empathy
Generating options to choose from	Choosing for someone who must own the choice

ON THE EXAM

High volume reading and drafting, with a human reviewer, is Claude's sweet spot.

The leverage test: four questions

- **Is there a lot to read, compare or draft?** That is where hours are saved.
- **Will a person review it before it matters?** A reviewer keeps a person accountable.
- **Can a mistake be caught and reversed?** The higher the cost of error, the more review.
- **Does it need facts Claude cannot see, or a judgement only a person can own?** Then Claude assists; it does not decide.

Choosing where to start at Halden

CANDIDATE	VALUE	RISK	REVIEWER IN PLACE?	VERDICT
Weekly service report first draft	High	Low	Operations manager	Start here
Tender answer first drafts	High	Medium	Bid writers	Start, with review
Apology emails after missed visits	Medium	Medium	Account manager	Pilot with checks
Shortlisting field-staff applicants	High	High	None proposed	Not as decider

ON THE EXAM

Start where value is high, risk is low and a reviewer already exists.

The use-case card

FIELD	HALDEN EXAMPLE: THE WEEKLY SERVICE REPORT
Users	Operations managers, one per region
Task	Draft the weekly service report across 260 sites
Inputs	Visit logs and the ticket export, uploaded each Monday
Output	Two pages in the house format, with exceptions first
Reviewer	The operations manager, before it is sent
Success measure	Drafting time against today's baseline; errors caught at review

THE TIEBREAKER

If you cannot fill in the card, the use case is not ready.

Which mode fits the use case?

USE CASE	MODE	WHAT THE PERSON DOES
Reformat the ticket export into a table	Automation	Sets the task, checks the result
Shape a bid strategy over several sessions	Augmentation	Thinks it through with Claude
A policy Project that supervisors ask directly	Agency	Designs and reviews the setup in advance

ON THE EXAM

The less you are in the loop at the moment of use, the more the setup must be designed and reviewed.

From conversations to requirements

01

Label sources

Who said it, in which meeting or document.

02

Extract

A structured prompt with fixed buckets.

03

Group and flag

Merge duplicates; flag gaps and conflicts.

04

Validate

Check each item against its source.

05

Document

With traceability back to the source.

ON THE EXAM

Label before you extract. Validate before you document.

The extraction prompt

- **Four buckets:** must-haves, nice-to-haves, open questions, and conflicts.
- **Every item carries its source** and a short supporting quote.
- **Ask for what is missing too:** topics the sources never settle.
- **Tell Claude not to resolve conflicts** or fill gaps with guesses. Flag them instead.

> THE TIEBREAKER
>
> "What are the requirements?" is a topic. The four buckets make it a task.

What a traceable requirement looks like

ID	REQUIREMENT	TYPE	SOURCE	QUOTE
R-01	Reception cover on Saturdays	Must	Facilities manager, interview 2	"Someone on the desk Saturdays"
R-02	Monthly satisfaction survey	Nice	Store manager, interview 4	"Would be good to have"
R-03	Meeting rooms cleaned daily before 8am	Conflict	Facilities manager vs finance lead	"Every day" vs "three days"
R-04	Keyholding arrangements	Open	Not settled in any source	-

ON THE EXAM

No quote, no requirement. Anything without a source is an open question.

Conflicting requirements: who resolves them?

CLAUDE'S JOB

Surface it

- Spot the conflict
- Quote both sides, with sources
- Note what each option implies
- Draft questions for the owners

PEOPLE'S JOB

Resolve it

- Take it back to the requirement owners
- Escalate to the sponsor if they cannot agree
- Record the decision and who made it
- Update the requirement and its trace

THE TIEBREAKER

Claude flags conflicts. The people who own the requirements resolve them.

Validate before you trust the list

- **Spot-check every must-have** against its quote in the original source.
- **Look for inventions:** an item with no findable source is removed or logged as an open question.
- **Look for omissions:** skim each source for anything the list missed.
- **Confirm with stakeholders** before the list becomes the specification.

> ON THE EXAM
>
> The list is a draft until people who own the requirements have confirmed it.

Use-case and requirements traps

THE TRAP	WHY IT FAILS
Claude makes the final call	Accountability sits with nobody
Asking for facts Claude cannot see	It fills the gap with a plausible guess
Merging sources with no labels	Nothing can be traced or checked
Letting Claude settle a conflict	Owners lose the decision that is theirs
Treating the first list as the spec	Inventions and omissions go unchecked
Starting with the riskiest use case	One failure sinks trust in the whole rollout

ON THE EXAM

Every trap removes either the source or the person.

> Halden's bid team answers about forty questions in each tender. Writers spend most of their time hunting through past bids and method statements for reusable material.
>
> The bid director asks where Claude should be used first.

Where will Claude add the most leverage?

A Deciding whether Halden should bid for the contract at all

B Drafting first answers from past bids and method statements, for writers to review

C Confirming the final price that Halden submits

D Signing off the declaration that the bid is compliant

◆ PAUSE AND DECIDE

Where will Claude add the most leverage?

A Deciding whether Halden should bid for the contract at all

A business decision with real consequences: the director's.

B Drafting first answers from past bids and method statements, for writers to review

Heavy reading and drafting, with a reviewer in place.

C Confirming the final price that Halden submits

A commercial commitment that finance must own.

D Signing off the declaration that the bid is compliant

An accountable sign-off; it cannot be delegated.

THE SIGNAL

Lots of reading, a first draft, and a person reviewing: Claude's sweet spot.

> A Halden operations manager wants help allocating tomorrow's reactive maintenance jobs. Engineer availability lives in the job-scheduling system.
>
> Claude has no connector to that system.

What is the best approach?

A Ask Claude which engineers are free tomorrow

B Ask Claude to estimate availability from typical rotas

C Upload last month's rota and ask Claude to work out tomorrow's

D Take availability from the scheduling system, then have Claude draft the allocation for her to check

◆ PAUSE AND DECIDE

What is the best approach?

A Ask Claude which engineers are free tomorrow

Claude cannot see the system; it can only guess.

B Ask Claude to estimate availability from typical rotas

A plausible estimate is not tomorrow's real availability.

C Upload last month's rota and ask Claude to work out tomorrow's

Last month's rota says nothing reliable about tomorrow.

D Take availability from the scheduling system, then have Claude draft the allocation for her to check

Real facts from the system; Claude drafts; she checks.

THE SIGNAL

Claude cannot see the system: bring it the facts, then let it draft.

> Halden is bidding for a new retail-park contract. The bid team has transcripts of six interviews with the client's staff.
>
> A bid writer will use Claude to turn them into a requirements list.

Which two practices will make the requirements reliable and traceable? Choose two.

A. Merge all six transcripts into one block without labels, to save time

B. Ask Claude to settle conflicting requests by choosing the most sensible one

C. Ask what the requirements are and use the answer as the specification

D. Label each transcript with the interviewee and date, and ask for a source and quote for every item

E. Ask Claude to sort items into must-haves, nice-to-haves, open questions and conflicts

◆ PAUSE AND DECIDE

Which two practices will make the requirements reliable and traceable? Choose two.

A Merge all six transcripts into one block without labels, to save time

Nothing can be traced back to who said it.

B Ask Claude to settle conflicting requests by choosing the most sensible one

Conflicts belong to the people who own them.

C Ask what the requirements are and use the answer as the specification

A topic, not a task, and an unchecked first draft.

D Label each transcript with the interviewee and date, and ask for a source and quote for every item

Labelled sources and quotes give traceability.

E Ask Claude to sort items into must-haves, nice-to-haves, open questions and conflicts

Fixed buckets give structure, and keep conflicts visible.

THE SIGNAL

Labels and quotes for traceability; fixed buckets for structure.

Halden's bid writer is turning the six interview transcripts into a requirements document for the retail-park bid.

(1) Check each requirement against its quote in the transcript.

(2) Label each transcript with the interviewee and date.

(3) Group the requirements, merging duplicates and flagging conflicts.

(4) Write up the requirements document with a source for every item.

(5) Extract requirements with a structured prompt.

What is the correct order?

A 5, 2, 3, 1, 4

B 2, 5, 3, 1, 4

C 2, 3, 5, 1, 4

D 2, 5, 3, 4, 1

◆ PAUSE AND DECIDE

What is the correct order?

A 5, 2, 3, 1, 4

Extracts before the sources are labelled.

B 2, 5, 3, 1, 4

Label, extract, group, validate, document.

C 2, 3, 5, 1, 4

Groups requirements that have not been extracted yet.

D 2, 5, 3, 4, 1

Documents the list before it has been checked.

THE SIGNAL

Label before you extract; validate before you document.

> Claude's requirements list flags a conflict. The client's facilities manager wants meeting rooms cleaned daily before 8am.
>
> The client's finance lead says the budget covers three days a week.

What should the bid writer do next?

A Ask Claude to choose the more reasonable of the two

B Put both in the bid and let the site team decide later

C Take the conflict, with both quotes, back to the client's stakeholders and record their decision

D Drop both requirements from the list to avoid an argument

◆ PAUSE AND DECIDE

What should the bid writer do next?

A Ask Claude to choose the more reasonable of the two

Claude would be making the client's decision.

B Put both in the bid and let the site team decide later

Promises two things, and pushes the conflict into delivery.

C Take the conflict, with both quotes, back to the client's stakeholders and record their decision

The owners resolve it; the decision is recorded.

D Drop both requirements from the list to avoid an argument

Loses a real need instead of settling it.

THE SIGNAL

Two owners disagree: send it back to them, with the evidence.

> Checking the extracted list, the bid writer finds a must-have for a 24-hour helpdesk.
>
> She cannot find it in any of the six transcripts. Every other item checks out.

What is the best action?

A Keep it, since Claude probably inferred it sensibly

B Discard the whole list and start again

C Regenerate the list with a more capable model

D Ask Claude for its source; if none exists, remove it or log it as an open question

◆ PAUSE AND DECIDE

What is the best action?

A Keep it, since Claude probably inferred it sensibly

An unsourced must-have could commit Halden to a costly service.

B Discard the whole list and start again

Throws away a list where everything else checks out.

C Regenerate the list with a more capable model

Any model can invent; the fix is checking the source.

D Ask Claude for its source; if none exists, remove it or log it as an open question

No quote, no requirement: remove it or ask the client.

THE SIGNAL

One unsourced item, the rest verified: trace it, then remove or ask.

In five lines

- **Claude drafts and synthesises; people decide** and stay accountable.
- **Most leverage:** heavy reading and drafting with a reviewer. **Least:** final decisions and facts it cannot see.
- **Start where** value is high, risk is low and a reviewer exists.
- **Requirements:** label, extract in four buckets, group and flag, validate, document with sources.
- **No quote, no requirement.** Conflicts go back to the people who own them.
