MODULE 10 · SECTION 2 - GOOGLE CLOUD'S GEN AI OFFERINGS

Why Google Cloud: the strengths the exam names

Seven reasons a business chooses Google Cloud for gen AI, and how to match each one to the worry in the question.

SECTION 2 of 4 EXAM WEIGHT ~35% MODULE 10 of 33

admin@sthithapragna.com

Every vendor says AI. The exam wants the **specific strength** that answers the worry in the question.

Seven strengths of Google Cloud for gen AI

AI-first
AI research built into everything

Enterprise-ready
Responsible, secure, private, reliable, scalable

Ecosystem
Works with your data and apps

Open approach
Many models
Open protocols

Why Google Cloud
Seven strengths from the exam guide
Match the worry to the strength

AI infrastructure
TPUs, GPUs
AI Hypercomputer

Data control
Your data stays yours

Democratisation
Low-code, no-code and APIs

ON THE EXAM

Each question describes one worry. Name the worry, then pick the strength that answers it.

AI-first: the research came from here

- **The Transformer,** the design behind today's LLMs, came from Google researchers in 2017.
- **Google DeepMind** builds Gemini, Gemma, Veo and Google's other models.
- **AI runs through** Google's own products, such as Search, Gmail, Maps and YouTube.
- **The same models** reach businesses through Agent Platform and Gemini Enterprise.
- **AI is built in** across the stack, from chips to apps, not bolted on.

THE SIGNAL

AI built into every layer, backed by long research: AI-first.

Enterprise-ready, in five words

WORD	WHAT IT MEANS FOR A BUSINESS
Responsible	AI Principles, safety filters, governance
Secure	Google's security, plus Model Armor
Private	Enterprise terms on how data is used
Reliable	Service levels and stable, versioned models
Scalable	From a pilot to millions of users

THE TIEBREAKER

A question that bundles security, reliability and scale for a live business service points to enterprise-ready.

Ecosystem: it works with what you have

- **Your data:** BigQuery, Cloud Storage and databases, used where they sit.
- **Your apps:** Gemini built into Google Workspace.
- **Other systems:** connectors to SharePoint, ServiceNow, Jira and Confluence.
- **Partners:** consultancies and software firms build on the platform.
- **Less moving** of data means faster projects and fewer risks.

> THE SIGNAL
>
> The story stresses systems and data you already have: ecosystem and integration.

Open approach: choice, not lock-in

- **Model Garden** offers more than 200 models in one place.
- **Google's models,** such as Gemini, Gemma, Veo and Chirp.
- **Partner models,** such as Anthropic's Claude, and open ones such as Llama.
- **Open protocols:** MCP connects agents to tools; A2A lets agents talk.
- **Open-source frameworks** and the Agent Development Kit.

> THE TIEBREAKER
>
> Wants a non-Google model, or fears lock-in: open approach.

AI Hypercomputer: three parts working as one

- **One integrated system** for training and serving AI at scale.
- **Hardware:** TPUs, NVIDIA GPUs, fast networking and storage.
- **Open software:** popular ML frameworks and Kubernetes, tuned for it.
- **Flexible consumption:** reservations, Spot VMs and flex-start capacity.
- **The goal:** better price-performance for heavy AI work.

> ON THE EXAM
>
> Training or serving large models, and price-performance at scale: AI-optimised infrastructure.

TPUs and GPUs

CHIP	BUILT FOR
GPU (NVIDIA)	Flexible work, broad software support
TPU	Google's own chip for AI maths
Ironwood	Seventh-generation TPU, for inference
TPU 8t	Training the largest models
TPU 8i	Fast inference and reasoning

CURRENCY CHECK

TPU 8t and TPU 8i were announced in April 2026. The guide simply says TPUs and GPUs.

Data control: your data stays yours

- **No training** on your data without your permission or instruction.
- **You choose the region** where data is stored and processed.
- **Access controls** decide who and what can reach the data.
- **Encryption,** with the option to manage your own keys.
- **Short-term caching** can be switched off for zero data retention.

> THE SIGNAL
>
> Fear that prompts will train someone else's model: data control.

Free consumer tool or enterprise service?

FREE CONSUMER TOOL

Built for individuals

- Terms written for individuals
- Little admin control
- No choice of region
- Outside company governance

GOOGLE CLOUD

Built for business

- Enterprise terms and contracts
- Admin and access controls
- Choice of region
- No training without permission

THE TAKEAWAY

Staff pasting customer data into a free tool is a governance problem. The fix is an approved enterprise service, not a ban on AI.

Democratisation: more people can build

- **No-code:** Workflow Builder in Gemini Enterprise builds agents in plain language.
- **Low-code:** Agent Studio for prompts, tuning and agents.
- **AutoML:** train a model on your images or tables without code.
- **BigQuery ML:** build models using SQL that analysts already know.
- **Pre-trained APIs:** call vision, speech, translation and documents.

> THE SIGNAL
>
> Few data scientists, many ideas, staff who cannot code: democratisation.

Strengths that sound alike

PAIR	THE TIEBREAKER
Open approach or ecosystem?	Choice of models, or fit with your systems
Data control or enterprise-ready?	Use of your data, or overall readiness
Infrastructure or democratisation?	Power for builders, or tools for non-experts
AI-first or open approach?	Google's own research, or others' models

REMEMBER

Read the worry, not the product names. The same product can appear under several strengths.

The Wrenfield board's questions

THE BOARD ASKS	THE STRENGTH THAT ANSWERS
"Will our prompts train their model?"	Data control
"Can we try a non-Google model?"	Open approach
"Will it reach BigQuery and Workspace?"	Ecosystem and integration
"We have 35 developers, not 300."	Democratisation
"Will it cope with Black Friday?"	Enterprise-ready: scalable

THE SIGNAL

Wrenfield already runs on Google Cloud and Workspace. In a question, that detail points to ecosystem.

> Wrenfield's security chief reviews a plan to send customer order details to Gemini on Agent Platform.
>
> Her one question: will those prompts be used to improve Google's models?

Which Google Cloud strength answers her concern?

A Open approach

B Data control

C AI-optimised infrastructure

D Democratisation

◆ PAUSE AND DECIDE

Which Google Cloud strength answers her concern?

A Open approach

About choosing models, not how your data is used.

B Data control

No training on your data without permission.

C AI-optimised infrastructure

About chips and capacity, not data use.

D Democratisation

About who can build, not about data.

THE SIGNAL

Will our data train their model? Data control.

> Wrenfield's catalogue team wants to compare Anthropic's Claude with Gemini for writing product copy.
>
> They want to do it on Google Cloud, without signing up with another provider.

Which strength makes this possible?

A Data control

B Ecosystem and integration

C Open approach

D AI-optimised infrastructure

◆ PAUSE AND DECIDE

Which strength makes this possible?

A Data control

About how data is used, not which models exist.

B Ecosystem and integration

About fitting your systems. The need is model choice.

C Open approach

Model Garden offers partner and open models too.

D AI-optimised infrastructure

About chips. Nothing here concerns compute.

THE SIGNAL

Wants a model Google did not make: open approach.

> Store managers want an assistant that answers staff questions about rotas and break rules. None of them can code, and the 35 developers are fully booked for a year.

What should a leader point them to?

A Train a custom model with Managed Training

B Reserve TPUs through AI Hypercomputer

C Build an agent in Python with the ADK

D Build it in Workflow Builder, a no-code tool

◆ PAUSE AND DECIDE

What should a leader point them to?

A Train a custom model with Managed Training
Needs ML engineers, and a model is not the gap.

B Reserve TPUs through AI Hypercomputer
Raw compute. Someone still has to build the assistant.

C Build an agent in Python with the ADK
A code-first kit. They cannot code.

D Build it in Workflow Builder, a no-code tool
No-code agents built in plain language: democratisation.

THE SIGNAL

Non-coders who need to build: democratisation through no-code tools.

> The firm that builds Wrenfield's warehouse picking robot trains its own large vision models. It wants accelerators built for AI, and the best price-performance as it scales.

Which Google Cloud offering fits best?

A TPUs on AI Hypercomputer

B Agent Studio

C Model Garden

D Gemini Enterprise

◆ PAUSE AND DECIDE

Which Google Cloud offering fits best?

A TPUs on AI Hypercomputer

Accelerators built for AI maths, for training at scale.

B Agent Studio

A low-code studio for prompts and agents, not compute.

C Model Garden

A catalogue of ready models. They train their own.

D Gemini Enterprise

An app for employees. It does not supply compute.

THE SIGNAL

Training large models, price-performance: AI-optimised infrastructure.

> Wrenfield's board is comparing AI vendors.
>
> The deciding point: its sales data already sits in BigQuery and head office works in Google Workspace. It wants AI to reach both without moving data.

Which strength matters most to this board?

A Open approach

B AI-first

C Ecosystem and integration

D Democratisation

◆ PAUSE AND DECIDE

Which strength matters most to this board?

A Open approach

About model choice, not reaching existing systems.

B AI-first

True of Google, but not what the board is weighing.

C Ecosystem and integration

AI that works with the data and apps they already use.

D Democratisation

About who can build, not where the data sits.

THE SIGNAL

Existing systems and data, no moving: ecosystem and integration.

> Wrenfield's online team is launching a shopping assistant before Black Friday, when traffic can rise tenfold.
>
> It needs a service level agreement, security approved by the CISO, and room to grow.

Which strength does the team need?

A AI-first

B Enterprise-ready

C Open approach

D Data control

◆ PAUSE AND DECIDE

Which strength does the team need?

A AI-first

Research history does not promise uptime or scale.

B Enterprise-ready

Secure, reliable and scalable, together.

C Open approach

About model choice. Nothing here asks for it.

D Data control

Part of the picture, but the need is wider than data.

THE SIGNAL

Security, service levels and scale together: enterprise-ready.

Module 10 in five lines

- Seven strengths: AI-first, enterprise-ready, ecosystem, open, infrastructure, data control, democratisation.
- Name the worry in the question first; the strength follows.
- Data control: no training on your data without your permission.
- Open approach: 200+ models in Model Garden, plus open protocols.
- AI Hypercomputer: TPUs and GPUs, open software, flexible consumption.
