MODULE 30 · EXAM STRATEGY - ALL SECTIONS

How Gen AI Leader questions are written

The anatomy of a question, the qualifier words that eliminate options, the five kinds of distractor, and a routine for every question.

COVERS All four sections SCENARIOS 6 MODULE 30 of 33

admin@sthithapragna.com

Every option can sound sensible. **The qualifier in the question** is what makes one of them right.

admin@sthithapragna.com

Four parts of a question

PART	WHAT TO DO WITH IT
The situation	Name the business and the job to be done
The constraint or qualifier	Underline it; it decides the answer
The ask	Read it first: best, first, most, why
Four options	Expect three that fit a different question

THE TIEBREAKER

Read the last sentence first. Knowing what is asked tells you what to look for in the situation.

What each qualifier eliminates

THE QUESTION SAYS	RULE OUT
"Quickly", "minimal effort"	Custom builds and model training
"Limited AI expertise", "no coding"	Code-first kits and custom ML
"Most cost-effective"	Fine-tuning, new models, bigger models
"Enterprise", "governance", "compliance"	Consumer tools and personal keys
"Prebuilt", "out of the box"	Anything you build yourself
"First", "best first step"	Steps that belong later

ON THE EXAM

Most qualifiers push towards the simplest, managed, lowest-rung option that still meets the need.

Four shapes you will meet

- **Best fit:** which product or technique suits this situation?
- **First step:** what should a leader do before anything else?
- **Definition:** which term matches this description?
- **Judgement:** why is this approach inappropriate, or risky?
- **Each shape** has its own trap, covered on the next slides.

> REMEMBER
>
> Name the shape as you read. It tells you which trap to watch for.

First-step and definition questions

FIRST STEP

Order matters

- Problem and outcome come first
- Then data and a baseline
- Then the tool or model
- Tool-first options are traps

DEFINITION

One phrase decides

- Match the exact description
- Similar terms are the distractors
- Ignore what sounds advanced
- Prompt tuning is not fine-tuning

THE TIEBREAKER

First-step questions reward process. Definition questions reward precision with words.

admin@sthithapragna.com

Five kinds of wrong answer

DISTRACTOR	HOW TO SPOT IT
True, but beside the point	Accurate, yet answers another question
Right idea, too heavy	Training or building when a tool exists
Newer-sounding name	Fresh name, wrong job
Right step, wrong order	Tool before problem, scale before pilot
Absolute words	"Always", "never", "guarantees"

THE TAKEAWAY

If you can name which kind of distractor an option is, you can eliminate it with confidence.

Five moves for every question

01
Ask
Read the last sentence first.

02
Qualifier
Underline the deciding word.

03
Job
Name the job in plain words.

04
Cut
Eliminate two distractors.

05
Choose
Let the qualifier pick between two.

REMEMBER

Do the same five moves every time. Under pressure, a routine beats instinct.

Managing ninety minutes

- **90 minutes** for 50 to 60 questions: about 90 to 108 seconds each.
- **Most questions** take less; that buys time for the hard ones.
- **Stuck after a minute?** Pick your best answer, flag it, move on.
- **Leave ten minutes** to revisit flagged questions.
- **Answer every question.** A blank answer can never score.

> THE TIEBREAKER
>
> Change a flagged answer only if you find a clear reason, such as a qualifier you missed.

> Wrenfield's marketing team wants to ask questions of its campaign briefs and get cited answers.
>
> They want it working this week, and nobody on the team writes code.

What should they use?

A. A RAG pipeline built with the ADK on Agent Platform

B. Gemini Notebook, with the briefs added as sources

C. Fine-tune Gemini on the briefs

D. Train a custom model with AutoML

◆ PAUSE AND DECIDE

What should they use?

A. A RAG pipeline built with the ADK on Agent Platform
Too heavy: it needs developers and time.

B. Gemini Notebook, with the briefs added as sources
Prebuilt, no code, cited answers, ready today.

C. Fine-tune Gemini on the briefs
Too heavy, and gives no citations.

D. Train a custom model with AutoML
Wrong tool, and too heavy.

THE SIGNAL

"This week" and "no code" rule out every build: choose the prebuilt tool.

> Wrenfield's store assistant must give current store opening hours, which change most weeks. The question asks for the most cost-effective approach.

Which approach fits best?

A Fine-tune the model every week

B Switch to a larger model

C Ground answers in the store hours data

D Train a new model on store data

◆ PAUSE AND DECIDE

Which approach fits best?

A Fine-tune the model every week

Costly, and always behind.

B Switch to a larger model

Costs more and still does not know the hours.

C Ground answers in the store hours data

Cheap, always current, no retraining.

D Train a new model on store data

The most costly option of all.

THE SIGNAL

"Most cost-effective" rules out training, tuning and bigger models.

> Wrenfield's operations director wants generative AI to cut the time it takes to process customer returns in the warehouse.

What is the best first step?

A Choose the most capable model

B Buy licences for warehouse staff

C Build a pilot agent

D Define the problem, and measure today's processing time

◆ PAUSE AND DECIDE

What is the best first step?

A Choose the most capable model

A tool before the problem.

B Buy licences for warehouse staff

Spending before knowing the need.

C Build a pilot agent

Building before defining success.

D Define the problem, and measure today's processing time

Problem and baseline come first.

THE SIGNAL

"First step": problem and baseline before any tool.

> A proposal uses a generative model to calculate the VAT on every supplier invoice.
>
> The question asks why this is inappropriate.

Which reason is best?

A The task needs exact, repeatable, rule-based results

B Generative models cannot read numbers

C Generative AI is too expensive for any finance task

D Generative models cannot run in a UK region

◆ PAUSE AND DECIDE

Which reason is best?

A The task needs exact, repeatable, rule-based results

Probabilistic output is wrong for a fixed rule.

B Generative models cannot read numbers

False: they read numbers well enough.

C Generative AI is too expensive for any finance task

An absolute claim, and untrue.

D Generative models cannot run in a UK region

False: regions can be chosen.

THE SIGNAL

Judgement questions: name the principle. Exact, rule-bound work suits rules, not gen AI.

> A question asks which statement about grounding is most accurate.

Which statement is most accurate?

A Grounding guarantees that answers are always correct

B Grounding retrains the model on your data

C Grounding ties answers to verifiable sources, reducing hallucinations

D Grounding works only with Google Search

◆ PAUSE AND DECIDE

Which statement is most accurate?

A Grounding guarantees that answers are always correct

"Guarantees" and "always": an absolute.

B Grounding retrains the model on your data

Confuses grounding with training.

C Grounding ties answers to verifiable sources, reducing hallucinations

Accurate and appropriately hedged.

D Grounding works only with Google Search

"Only": an absolute, and false.

THE SIGNAL

Absolute words such as always, guarantees and only are almost always wrong.

> A question describes a model that creates images by starting from random noise and refining it, step by step, into a picture.

Which term does it describe?

A. A large language model

B. A diffusion model

C. Reinforcement learning

D. A clustering model

◆ PAUSE AND DECIDE

Which term does it describe?

A. A large language model
Predicts text, one token at a time.

B. A diffusion model
Refines noise into an image, step by step.

C. Reinforcement learning
Learns from rewards, not noise.

D. A clustering model
Groups data; it does not create images.

THE SIGNAL

Definition questions: match the exact phrase, not the most impressive term.

Module 30 in five lines

- Read the ask first, then underline the qualifier.
- Quickly, no code, cost-effective, prebuilt: choose the simplest managed option.
- First-step questions reward order: problem, baseline, then tools.
- Five distractors: beside the point, too heavy, newer name, wrong order, absolutes.
- About 90 to 108 seconds each; flag, move on, answer everything.
